

Map 8.1 Shallow Landslide Hazards

-  High potential landslide hazards
-  Moderately high potential landslide hazards

Landslide potential based on slopes that may fail after 100 mm of rainfall or less, in one event.

Sources:
Debris flow hazards are based on SHALSTAB, Shallow landslide predictive model based on soil bulk density of 1700 kg/m³ a friction angle of 45 degrees.

Map scale = 1:350,000
